

Question 1 = 10, 13, 18, 22, 27, 32, 38, 40, 45, 51, 56, 57, 88, 90, 92, 94, 99

class Interval	No
10-20	2
20-30	2
30-40	2
40-50	2
50-60	3
60-70	
70-80	
80-90	1
90-100	4

Bin Size = 10

Question 2 = In the Quard test of CAT exam, the population standard deviation is known to be 100. A sample of 25 test takers has a mean of 520. Construct a 90% CI about mean.

$$\sigma = 100, n = 25, \bar{x} = 520, CI = 80\%$$

$$\alpha = 1 - CI = 1 - 0.80 = 0.2$$

Point estimate \pm margin of error

$$\bar{x} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$$

$$z_{\alpha/2} = \frac{0.2}{2} = 0.1$$

$$= 1 - 0.1 = 0.9 = \boxed{1.29}$$

$$\text{Lower fence} = \bar{x} - z_{\alpha/2} \left(\frac{\sigma}{\sqrt{n}} \right)$$

$$= 508.994.2$$

$$\text{Higher fence} = \bar{x} + z_{\alpha/2} \left(\frac{\sigma}{\sqrt{n}} \right)$$

$$= 545.8$$

Question

A Car Company believes that the Percentage of residents in City ABC that own a vehicle is 60% or less. A sales manager disagrees with this. He conducts a Hypothesis testing surveying 250 residents and found that 170 responses yes to owning a vehicle.

- (A) State the null and alternate Hypothesis
(B) At 10% significance level, is there enough evidence to support the idea that vehicle ownership in city ABC is 60% or less?

Solution

Null Hypothesis $H_0 = P_0 = 60\%$

Alternate Hypothesis $H_1 = P_0 \neq 60\%$

$$q/p = 40\% \text{ i.e. } 0.40$$

$$N = 250$$

$$x = 170$$

$$\hat{P} = \frac{x}{n} = \frac{170}{250} = 0.68$$

Significance level = 10%

Confidence interval = 90%

one tail test

$$z\text{-test} = \frac{\hat{P} - P_0}{\sqrt{\frac{P_0 q_0}{n}}}$$

$$= \frac{0.68 - 0.60}{\sqrt{\frac{0.60 \times 0.40}{250}}} = \underline{\underline{2.653}}$$

$\Rightarrow 2.6537 - 2.32$ (Accept the null Hypothesis)

$\Rightarrow P\text{-value} = 0.99598 > 0.10$ (Accept the null Hypothesis)

Ques 4: 2, 2, 3, 4, 5, 5, 5, 6, 7, 8, 8, 8, 8, 8, 9, 9, 10, 11, 11, 12

$$\frac{\text{Percentile}}{100} \times n+1$$

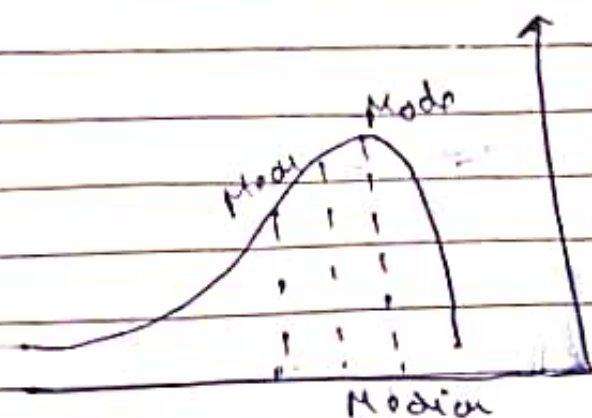

$$= \frac{99}{100} \times (20+1) = 20.79$$

$$= \boxed{12}$$

Relationship b/w mean/median and mode

$\text{Mean} > \text{Median} > \text{Mode}$
eg = Wealth distribution

$\text{Mode} > \text{Median} > \text{Mean}$
eg = life span
